Genetic drift can also be magnified by natural or human-caused events, such as a disaster that randomly kills a large portion of the population, which is known as the bottleneck effect that results in a large portion of the genome suddenly being wiped out (Figure 11.2.2). In one fell swoop, the genetic structure of the survivors becomes the genetic structure of the entire population, which may ...

Mechanisms: the processes of evolution. Evolution is the process by which modern organisms have descended from ancient ancestors. Evolution is responsible for both the remarkable similarities we see across all life and the amazing diversity of that life — but exactly how does it work?

Mechanisms: the processes of evolution

A change in environment can cause previously neutral alleles to have selective values; in the short term evolution can run on “stored” variation and thus is independent of mutation rate. Other mechanisms can also contribute selectable variation.

French biologist; proposed mechanisms for how life changes over time; use and disuse and inheritance of acquired characteristics. Remembered more for incorrect mechanism he proposed to explain how evolution works than for visionary recognition that evolutionary change explains patterns in fossils and match of organisms to its environment; also thought evolution happens because organisms have ...

Evolution Definition. Evolution (e·vo·lu·tion, 'ɛvəlʊːʃ(ə)n) is defined as a change in the genetic composition of a population over successive generations. When we hear “evolution”, we often think of a progressive change. However, evolutionary changes are not directed toward perfection or even toward some defined goal.

Examples of Evolving Species. Evolution is the interaction between genetic changes and natural selection, also known as "survival of the fittest." Charles Darwin famously studied various species to determine how environmental adaptations allowed them to survive. Natural selection reflects a species' decision to pass down favorable genes and how well a species can use its traits to survive its ...

Lamarckism, or Lamarckian inheritance, also known as "Neo-Lamarckism", is the notion that an organism can pass on to its offspring physical characteristics that the parent organism acquired through use or disuse during its lifetime. It is also called the inheritance of acquired characteristics or soft inheritance. The idea is named after the French zoologist Jean-Baptiste Lamarck (1744-1829 ...

Nonetheless, there is not much literature on the use of active learning to present evolutionary principles. Most students begin their introductory biology classes in college having heard of natural selection, yet few appreciate that there are other significant mechanisms of evolution, namely, genetic drift, mutation, and gene flow.
