From Mental Imagery to Spatial Cognition and Language

Mental Imagery/Impact of Attention and Spatial Ordering Mental imagery refers to the process of picturing an event, concept, or procedure in your mind. In math, one way students use mental images is to reinforce their understanding of new concepts. By translating a verbal description of a new concept into a visual picture, a student can better ...

Mental Imagery/Impact of Attention and Spatial Ordering

Spatial imagery is imagery of spatial relationships. If I ask you to imagine the room in which you spend most of your time awake if you produce a picture of this in your mind it is spatial imagery, particularly if it is a three dimensional mental representation. This idea is related to that of cognitive maps, cognitive control

The hippocampus and spatial constraints on mental imagery

The scientific investigation of mental imagery has a long and colorful history (see, e.g., Paivio, 1971; Yates, 1966) that ties it closely to the visual and spatial knowledge that we use in remembering environments.

To a first approximation, the analog side of the debate holds that the mental representations that we experience as imagery are, in some important sense, like pictures, with intrinsically spatial representational properties of the sort that pictures have (i.e., pictures do not just represent spatial relationships between the objects they depict, but represent those relationships, at least in part, via actual spatial relationships on the picture surface).

Mental Imagery (Stanford Encyclopedia of Philosophy)

Whereas spatial perception involves understanding externally via the senses, spatial visualization is the understanding internally through mental imagery in one's mind. Another critical spatial visualization ability is mental animation.

Spatial ability - Wikipedia

The spatial abilities tested in these studies involved mental imagery such as visualization of two and three-dimensional objects and manipulation of mental representations (e.g., mental rotation). Mental images are the building blocks of human consciousness that comprise one's internal representation of the world.

Positron emission tomography (PET) was used to monitor regional cerebral blood flow variations while subjects were constructing mental images of objects made of three-dimensional cube assemblies from auditorily presented instructions. This spatial mental imagery task was contrasted with both passive listening (LIST) of phonetically matched nonspatial word lists and a silent rest (REST) condition.

Neural substrates of visual imagery. Visual imagery is the ability to create mental representations of things, people, and places that are absent from an individual's visual field. This ability is crucial to problem-solving tasks, memory, and spatial reasoning. Neuroscientists have found that imagery and perception share many of the same neural substrates, or areas of the brain that function ...

Mental imagery ability is also directly linked to true and false memory processes: Children's faster and more accurate image generation enhances visuo-spatial recall ([8], see [9] for findings in adults).

Mental Imagery. Mental imagery is similar to motor imagery, but instead of imagining motions, the user performs different types of cognitive activities: mental subtraction, auditory imagery,

spatial navigation, etc. (Friedrich et al., 2012) As the frequency distribution of the EEG changes depending on the user's mental workload (Herrmann et al ...
