Subsurface geological features of interest in hydrocarbon exploration are three-dimensional (3-D) in nature. Examples are salt diapirs, overthrust and folded belts, major unconformities, reefs, and deltaic sands. A two-dimensional (2-D) seismic section is a cross section of a 3-D seismic response.

Three-dimensional seismic method - AAPG Wiki

The interpretation process can be subdivided into three interrelated categories: structural, stratigraphic, and lithologic. Structural seismic interpretation is directed toward the creation of structural maps of the subsurface from the observed three-dimensional configuration of arrival times.

Three-dimensional (3-D) seismic: data, properly integrated with other data sets, represent a hitherto underexploited data set for sequence stratigraphic analyses. The Bone Spring Fm (Leonardian) of New Mexico provides an exciting test of the applicability of 3-D seismic data sets to study the sequence stratigraphic development of such an unit.
