The robots that Schuerle used in this study are 35 hundredths of a millimeter long, similar in size to a single cell, and can be controlled by applying an external magnetic field. This bioinspired robot, which the researchers call an “artificial bacterial flagellum,” consists of a tiny helix that resembles the flagella that many bacteria use to propel themselves.

Multi-Robot Task Allocation is a crucial issue before performing a certain task. This paper deals with a distributed task allocation method based on some special relation defined according to the performance of history cooperation between two robots. The algorithm we propose here is named TARARC—a Task Allocation algorithm based on Robot Ability and Relevance with group Collaboration, where ...

robots—that are capable of replacing human labor in a range of tasks. Industrial robots are argued to have already deeply impacted the labor market and are expected to transform it in the decades to come (e.g., Brynjolfsson and McAfee, 2012; Ford, 2016). Indeed, between 1993 and 2007 the stock of robots in the United States and Western
