Principles of aperture and array system design: Including random and adaptive arrays. Steinberg, B. D. Abstract. The book is concerned with two major disciplines in array design: the geometric properties of arrays, which are handled by physical optics, Fourier and Fresnel transforms, and convolution theory, and the relation of array properties to properties of systems within which the array serves as the transducer.

The studies suggest that the performance improves as the array aperture increases, but the impact of the aperture is mainly visible when the users are closely grouped (i.e., they have high correlation). Furthermore, there is in general a good channel resolvability in the sense that the larger the aperture, the greater the resolvability.

For a given aperture (A), the focus length (L) DECREASES as the focal distance (zfoco) DECREASES. The maximum focal distance (zfoco(MAX)) must be inside the near-field No. $A \Rightarrow$ Active aperture. $V \Rightarrow$ Velocity of propagation. Dynamic. Depth Focusing (DDF) The DDF dynamically changes the focal distance as the signal returns to the phased array probe.

Chapter 11, which covers aperture and array antennas, discusses in detail the important concepts underlying phase array antennas, including linear, planar, circular, and conformal arrays. Two tables list all equations to calculate null, main lobe maxima, half-power points, and minor lobe maxima for endfire and broadside array, and many good examples of design array antennas are provided.

Developed from the author's graduate-level courses, the first edition of this book filled the need for a comprehensive, self-contained, and hands-on treatment of radar systems analysis and design. It quickly became a bestseller and was widely adopted by many professors. The second edition built on this successful format by rearranging and updating topics and code. Reorganized, expanded,
