ROP: Retinopathy of Prematurity Diagnosis and Treatment ...

In recent years there has been renewed interest in retinopathy of prematurity (ROP), so it is timely that this issue of Community Eye Health contains three articles on this subject. First described in the 1940s, when it was known as retrolental fibroplasia (RLF), it was not for another ten years or so that oxygen administration was identified as a factor in its pathogenesis.

Community Eye Health Journal » Retinopathy of prematurity

Retinopathy of prematurity (ROP) is a developmental disorder of the eye occurring in small, very premature neonates. In some cases, if untreated, it results in tractional retinal detachment and blindness. Severe ROP must be diagnosed in a timely manner and treated effectively to avoid progression to blindness.

AAP, others issue updated recommendations on retinopathy ...

The immature retinas of preterm neonates are susceptible to insults that disrupt neurovascular growth, leading to retinopathy of prematurity. Suppression of growth factors due to hyperoxia and loss of the maternal-fetal interaction result in an arrest of retinal vascularisation (phase 1).

Retinopathy of prematurity - The Lancet

Retinopathy of prematurity, also called retrolental fibroplasia and Terry syndrome, is a disease of the eye affecting prematurely born babies generally having received neonatal intensive care, in which oxygen therapy is used due to the premature development of their lungs. It is thought to be caused by disorganized growth of retinal blood vessels which may result in scarring and retinal detachment. ROP can be mild and may resolve
