Application of Skills & Concepts MAFS. 8.EE.2.6 Use similar triangles to explain why the slope m is the same between any two distinct points on a non-vertical line in the coordinate plane; derive the equation $y = mx$ for a line through the origin and the equation $y = mx + b$ for a

Mathematics Florida Standards (MAFS) Grade 8

An Introduction to Trigonometry
P.Maidorn I. Basic Concepts The trigonometric functions are based on the unit circle, that is a circle with radius $r=1$. Since the circumference of a circle with radius r is $C=2\pi r$, the unit circle has circumference 2π . For any point (x,y) on the unit circle, the associated angle θ can be measured in two different

$a^2 + b^2 = h^2$ Pythagoras' Theorem or, the square of the longest side is the same as the sum of the squares of the other two sides. $h^2 = a^2 + b^2$ is only true for right-angled triangles. If all the angles of a triangle are less than 90° then $h^2 < a^2 + b^2$ For example, in an equilateral triangle with sides 1 1 1 and all angles 60° $1^2 = 1 \dots$
