A Line In Three Circles
In geometry, Monge's theorem, named after Gaspard Monge, states that for any three circles in a plane, none of which is completely inside one of the others, the intersection points of each of the three pairs of external tangent lines are collinear.. For any two circles in a plane, an external tangent is a line that is tangent to both circles but does not pass between them.

In the figure below, three circles are tangent to each other and to line L. The radius of circle A is equal to 10 cm and the radius of circle B is equal to 8 cm. Find the radius of circle C. Solution to Problem. Let a, b and c be the radii of the three circles. We first draw the lines AA', BB' and CC' perpendicular to line L. B'C, CA' and BA ...

Three Tangent Circles - Problem With Solution
In geometry, the notion of line or straight line was introduced by ancient mathematicians to represent straight objects (i.e., having no curvature) with negligible width and depth. Lines are an idealization of such objects, which are often described in terms of two points (e.g., A B ↔ {\displaystyle {\overleftrightarrow {AB}}}) or referred to using a single letter (e.g., ℓ {\displaystyle ...

Example 3 - Circle tangent line when point is on the circle Find the equation of the tangent line to the circle $x^2 + y^2 + 3x − 4y − 1 = 0$ and a point $(−4, 1)$ which lies on the circle. The solution of this problem can be solved in different ways we will show two methods.

A line segment that has its endpoints on the circular border but does not pass through the midpoint is called a chord. The distance around the circle is called the circumference, C, and could be determined either by using the radius, r, or the diameter, d:

A circle is defined by any three non-collinear points. This means that, given any three points that are not on the same line, you can draw a circle that passes through them.

A line tangent to a circle touches the circle at exactly one point. The tangent line is perpendicular to the radius of the circle. In maths problems, one can encounter either of two options: constructing the tangent from a point outside of the circle, or constructing the tangent to a circle at a point on the circle.

When dealing with a line segment it may be more efficient to first determine whether the line actually intersects the sphere or circle. This is achieved by noting that the closest point on the line through $P_1 P_2$ to the point P_3 is along a perpendicular from P_3 to the line. In other words if P is the closest point on the line then

Given three points, it is always possible to draw a circle that passes through all three. This page shows how to construct (draw) a circle through 3 given points with compass and straightedge or ruler. It works by joining two pairs of points to create two chords. The perpendicular bisectors of a chords always passes through the center of the circle.
