So the probability to win a prize the first time you play is $p^2 + p(1-p)^2 + (1-p)^2$. Clearly M has a geometric distribution, with parameter p . $p^2 + p(1-p)^2 + (1-p)^2$. 4.12 The "probability that your friend wins" is equal to. $p + p(1-p)^2 + p(1-p)^4 + \dots = p \cdot 1 + (1-p)^2 = 1 - 2(1-p)$.

The general principle Before testing hypothesis we already have a random model for data, and both of hypotheses determine a parameter of the model and hence determine the random model. We can calculate the probability that our data occurs under each hypothesis and reject hypothesis that is smaller than the given p -value.

In probability theory, the law of large numbers (LLN) is a theorem that describes the result of performing the same experiment a large number of times. According to the law, the average of the results obtained from a large number of trials should be close to the expected value and will tend to become closer to the expected value as more trials are performed.
