Introduction. Computed tomography (CT) and positron emission tomography (PET) play important roles in classifying lung cancers according to the tumor, node, metastasis (TNM) system, particularly those in the clinical or pretreatment stage (cTNM) (1,2).For lung cancer, the cTNM stage is determined on the basis of the extent of the cancer before the initiation of primary treatment (ie ...

Critical Appraisal: The I-ELCAP Study. In its October 26, 2006, issue, the New England Journal of Medicine published the results of the International Early Lung Cancer Action Program (I-ELCAP) study, a large clinical research study examining annual computed tomography (CT) screening for lung cancer in asymptomatic persons. Though the authors concluded that the screening program could save ...

Lung cancer is a disease in which malignant (cancer) cells form in the tissues of the lung. The lungs are a pair of cone-shaped breathing organs in the chest. The lungs bring oxygen into the body as you breathe in. They release carbon dioxide, a waste product of the body's cells, as you breathe out. Each lung has sections called lobes. The left lung has two lobes.
