the two-phase fluid as a single homogeneous "compressible" fluid. Leung's method does this by calculating a compressible flow parameter, β . This parameter is a measure of the fluids "compressibility". The larger the value of β , the more the fluid behaves like a compressible fluid. Based on the API,

Although there are good agreements between the DSMC results and the analytical solutions in low compressible flow, the analytical solutions yield incorrect velocity and mass flow rate values in short micro/nanochannel flows with high compressibility and/or choked flow conditions. ... The governing equations of compressible fluid flow have been solved numerically using flux vector splitting method to obtain running time under which it works at the design Mach number. The formulation has been tested on the theory of quasi one-dimensional compressible flow. The numerical results are in good agreement with the results of the ...
