### Digital Interactive Tv And Metadata

Digital television is a hybrid platform combining elements from classical analog television and the Internet, providing modern multimedia services on a familiar platform. In short, digital TV is a gateway to the world of interactive digital media. Digital TV brings consumers into the television service arena and offers them new degrees of freedom.

The digital broadcast item model (DBIM) catalyzes the digital item methodology of MPEG-21 into a new converging concept for deploying metadata-based services in digital TV. The idea of the digital broadcast item model (DBIM) goes back to the year 2001, when the IEEE standard for the learning object model (LOM) was presented at a conference in Tampere, Finland.

3. A metadata model to support scalable TV services This section details the conceptual model that provides the basis for our metadata framework for describing scal-able interactive TV services. The model, outlined in Fig-ure 1, describes such a service as an enriched TV program. We detail this model by introducing the underlying ratio-

### A metadata model supporting scalable interactive TV services

Digital television (digiTV) is an additional multimedia environment, where metadata is one key element for the description of arbitrary content. This implies adequate structures for content description, which is provided by XML metadata schemes (e.g. MPEG-7, MPEG-21).

### A Digital Broadcast Item (DBI) enabling metadata ...

This paper presents a self-designed metadata model to an interactive push service in digital TV, where the service can not only diversify existing types of broadcast programs, but also provide personalized application for consumers. In order to realize it, a metadata model is created by extracting and combining certain parts of various metadata standards, such as MPEG-21 standard to define ...
