Advance steel used the DIN 6935 standard , this is very typical code and based upon internal radius value being the thickness of the materials , with a designated K factor. It works to that with the standard bend radius from model and settings.

### K Factor - Autodesk Community

Description. We had been through several issues with K-factor handling of two groups according to two different standards which uses same name. As it turns out, ANSI and DIN has defined the same term for the same purpose but with different reference points, so there is a serious ambiguity: K-factor (ANSI), K-factor (DIN) Expected behavior would be choosing a different name for the "second" K ...

### **Which K-factor (metal bending) is defined first, ANSI or DIN?**

A K-Factor will typically range between 0 and .5 for standard materials and thicknesses though smaller and larger K-Factors are possible. To help you begin I've included a K-Factor Chart below which contains common K-Factor starting points, good for general fabrication, for steel, aluminum and stainless steel.

If we consider the K-factor formula in the DIN standard, SW has to add the  $a/2$  to the end of the equation. However, according to Anna Wood and Bernie Daraz who are experienced in the field, the correct K-factor value or bed allowance/bend deduction values has to be based only on the workshops or bending services.

Read the "Instructions" tab, then input your information in the "Bend Allowance K-Factor" tab and the "Bend Table" tab. The Bend Equations are shown in the instructions. In the equations I use, material type is controlled by something called an F-Factor. The F-Factor which is specific to steel, hard brass, copper, and aluminum is 0.64.
