A force is a push or pull acting upon an object as a result of its interaction with another object. There are a variety of types of forces. Previously in this lesson, a variety of force types were placed into two broad category headings on the basis of whether the force resulted from the contact or non-contact of the two interacting objects.

The first five forms were described in some detail, under slightly different labels, in Mintzberg (1979). The last two forms were developed in: H. Mintzberg, Power In and Around Organizations (Englewood Cliffs, New Jersey: Prentice-Hall, 1983). 5. D. Miller and M. Kets de Vries, The Neurotic Organization (San Francisco: Jossey-Bass, 1984). The Effective Organization: Forces and Forms

Force is the external agent that produces motion or tends to produce motion or it stops motion or tends to stop motion. Basically, there are two types of forces, contact forces, and non-contact forces. Gravitational forces, electric forces, magnetic forces, nuclear forces, frictional forces are some examples of force.

Force Closure. Although form closure provides stability to the SIJ, for mobility to occur further joint compression and stabilisation is required to withstand a vertical load .Force closure is the term used to describe the other forces acting across the joint to create stability.This force is generated by structures with a fibre direction perpendicular to the sacroiliac joint and is adjustable ...

Force can also be described intuitively as a push or a pull. A force has both magnitude and direction, making it a vector quantity. It is measured in the SI unit of newtons and represented by the symbol F . The original form of Newton's second law states that the net force acting upon an object is equal to the rate at which its momentum changes with time.

Spring Force - The amount of force necessary to compress a spring depends on the material from which the spring is made, the diameter of the wire that forms the coils, and the number of coils. These properties are quantified in a number characteristic of the spring called the spring constant "k." The force needed to compress the spring a distance "x" is given by Hooke's Law: $F = kx$.
