An Integrated Delivery for Gas-Insulated Substation Execution. When power is on the line, it is critical that reliable energy delivery meet the needs of the community it serves — both functionally and in project execution. For utilities providing electricity in urban areas, gas-insulated substations (GIS) are often the right fit due to their advantages in space requirements, aesthetics and reliability.

Superior Dielectric Gas. A gas-insulated substation (GIS) uses a superior dielectric gas, SF6, at moderate pressure for phase-to-phase and phase-to-ground insulation.The high voltage conductors, circuit breaker interrupters, switches, current transformers, and voltage transformers are in SF6 gas inside grounded metal enclosures.

GIS substations utilize mounted and fixed circuit breakers. The sealed mounted beakers are considered 'sealed-for-life' technology. On the contrary; AIS switchgear could be eliminated for troubleshooting and maintenance. Design Standards. When it comes to design, AIS has: IEC (e.g. IEC 62271-1, IEC 62271-200, IEC 62271-100 ...etc)

Installing a GIS high voltage substation can be faster than installing its metal-clad AIS counterpart. This is largely due to the fact that GIS systems are significantly smaller and weigh less (despite the gas weighing more than air). Provided the technician doesn't need to handle the gas itself, GIS substations are quicker to install.
