Digital image enhancement has been proposed as an aid for the visually impaired. The capability of two enhancement techniques to improve recognition of images by patients with central scotoma or...

Image Enhancement for the Visually Impaired

Image enhancement has been shown to improve face recognition by visually impaired observers. We conducted three experiments in an effort to refine our understanding of the parameters leading to this effect. In experiment 1 we found that the band of spatial frequencies between 4 and 8 cycles/face is critical for face recognition.

Image enhancement as an aid for the visually impaired may improve visibility of TV programs and provide portable visual aid. This paper describes the current techniques for image enhancement and their underlying models. The limitations of the various techniques and of potential methods of implementation are

Limitations of image enhancement for the visually impaired.

The number of visually impaired people in this world amounts to 342 million (more than the entire population of the United States), a number that is shared by both ends of life, the young and the old. Of this number, 23.7 million are U.S. adults experiencing some sort of vision loss. Among those visually impaired, 70% are unemployed and are 3 times more likely to end up in long term care, all ...

6 Vision Enhancement Devices You Need to See

The wideband image enhancement consists of locating visually relevant features in the image (edges and bars) and enhancing the contrast of the pixels of such features¹⁴. The edge detection algorithm used for the wideband enhancement is a dual polarity edge detector based on a vision model¹⁵(Fig. 4).

IMAGE ENHANCEMENT FOR IMPAIRED VISION: THE CHALLENGE OF ...

Digital image enhancement to improve video images for the visually impaired was first proposed by Peli & Peli ³ (applying an adaptive enhancement algorithm) and Peli et al. ⁴ investigated the use of a number of common image enhancement algorithms.

MPEG-based image enhancement for the visually impaired

Image enhancement and discriminability simulation were based on modeling of contrast sensitivity loss for the low vision patient with central scotoma size of ± 10 degrees of the visual field. The results are compared with other methods of image enhancement.

Image enhancement methods for the visually impaired

An MPEG-based image contrast enhancement algorithm for people with low vision is presented. Contrast enhancement is achieved by modifying the inter- and intra-quantization matrices in the MPEG decoder during the decompression stage.

Results show that Tinted Reduced Outlined Nature (TRON) and Edge Overlaying algorithms are most beneficial for dynamic scenes such as motion detection. Image Cartoonization was most beneficial for spatial feature detection such as face detection. Patient's stated that they would most like to see Cartoonized images for use in daily life.

Designing and testing scene enhancement algorithms for ...

Image enhancement techniques are used to refine a given image, so that desired image features become easier to perceive for the human visual system or more likely to be detected by automated image analysis systems [1, 13]. Image enhancement allows the observer to see details in images that may not be immediately observable in the original image.

In this paper, we present a conditional generative adversarial network-based model for real-time underwater image enhancement. To supervise the adversarial training, we formulate an objective function that evaluates the perceptual image quality based on its global content, color, local texture, and style information. We also present EUVP, a large-scale dataset of a paired and unpaired ...
