They open as the soil dries out and close upon rewetting. Less commonly, some trans-horizon cracks form upon dewatering and subsequent consolidation of poorly drained sediments with high n value (fluid materials), e.g., upon drainage of some soils that are classified as Hydraquents. Once formed, these cracks do not open and close seasonally but ...

Brine is a high-concentration solution of salt (NaCl) in water (H₂O). In diverse contexts, brine may refer to the salt solutions ranging from about 3.5% (a typical concentration of seawater, on the lower end of that of solutions used for brining foods) up to about 26% (a typical saturated solution, depending on temperature). Brine forms naturally due to evaporation of ground saline water but ...

The two subtle stages of salinity stress are seed germination and early seedling growth (Jones, 1986). The symptoms also depend on the duration of exposure to the stress, which are enlisted in Table 1.2. Besides the previously discussed adverse effects, soil salinity also has some beneficial effects which are summarized in Table 1.3.
