The Expanding World of Small Molecule Microarrays

Microarrays of small molecules have already been successfully applied in important areas ranging from protein profiling to the discovery of therapeutic leads. Recent interesting developments towards improved immobilization strategies and library creation methods, together with novel advances herein described, have set the stage for SMMs to take on wider and more routine applications in academia and industry.

Small molecule microarrays: recent advances and applications.

Abstract The technique of small-molecule microarray (SMM) screening is based on the ability of small molecules to bind to various soluble proteins. This type of interaction is easily detected by the presence of a fluorescence signal produced by labeled antibodies that specifically recognize a unique sequence (tag) present on the target protein.

BSA has been used as a scaffold for immobilizing conjugated peptides or small molecules (less than 300 ~ 500 daltons) on glass slides to form microarrays. Since BSA is a relatively inert protein, it is also used often as a blocking agent in microarray-based application to prevent non-specific probe-surface binding.
