In spatial econometrics, there are two representative models that are used to consider spatial autocorrelation (or dependence) among data—spatial lag model (SLM), which considers it as autocorrelation among observed variables, and spatial error model (SEM), which considers it as autocorrelation of error terms.

Spatial econometrics is a refinement of this, where either the theoretical model involves interactions between different entities, or the data observations are not truly independent. Thus, models incorporating spatial auto-correlation or neighborhood effects can be estimated using spatial econometric methods.

An introduction to spatial econometric models and methods is provided that discusses spatial autoregressive processes that can be used to extend conventional regression models. Estimation and interpretation of these models are illustrated with an applied example that examines the relationship between commuting to work times and transportation mode choice for a sample of 3,110 US counties in the year 2000.
