Sql Precompiler In Oracle Database

To run the Oracle Pro*COBOL Precompiler, you issue the command `procob [option_name = value] [option_name = value] ...`. The option value is always separated from the option name by an equals sign (=), with no white space around the equals sign. For example, the INAME option specifies the source file to be precompiled. The command:

To process a SQL statement, Oracle opens a work area called a private SQL area. The private SQL area stores information needed to execute the SQL statement. An identifier called a cursor lets you name a SQL statement, access the information in its private SQL area, and, to some extent, control its processing.

Oracle OCI (Oracle Call Interface) provides an alternate lower-level interface to the Oracle database. The SQL precompilers for the various host languages (Pro*C, Pro*Ada, Pro*Fortran, Pro*COBOL, etc.) reads EXEC SQL commands and generate data structures and calls to its runtime library: SQLLIB (libsql.a in UNIX).

The precompiler does not reuse the link unless the number of open cursors exceeds the value of MAXOPENCURSORS. This is useful for SQL statements that are often executed because it speeds up subsequent executions. There is no need to re-parse the statement or allocate memory for an Oracle private SQL area.

Static Versus Dynamic SQL Statements. Most application programs are designed to process static SQL statements and fixed transactions. In this case, you know the makeup of each SQL statement and transaction before runtime; that is, you know which SQL commands will be issued, which database tables might be changed, which columns will be updated, and so on.

1 Introduction - Florida A&M University

Embedded SQL is a method of combining the computing power of a programming language and the database manipulation capabilities of SQL. Embedded SQL statements are SQL statements written inline with the program source code, of the host language. The embedded SQL statements are parsed by an embedded SQL preprocessor and replaced by host-language calls to a code library.
