1.2. The volume expansivity and the isothermal compressibility coefficients Generally, any property of a system with simple and pure substance is often expressed as a function of the two basic thermodynamic properties, for example, temperature and pressure (T, p), or specific volume and temperature (v, T), etc.

### THE VOLUME EXPANSIVITY AND THE ISOTHERMAL COMPRESSIBILITY ...

Volume expansivity is the fractional increase in volume of a solid, liquid, or gas per unit rise in temperature, i.e.  $V_2 = V_1 (1$

+  $\gamma\theta$ ), where  $\gamma$  is the cubic expansivity and  $\gamma = 3\alpha$ . For liquids, the expansivity observed directly is called the apparent expansivity as the container will also have expanded with the rise in temperature.

## Expansivity - Oxford Reference

Isobaric Thermal Expansivity ( $\alpha$ ) Another very important property of a substance is how its volume will respond to changes in temperature. Again, gases respond profoundly to changes in temperature (think Charles' Law!) whereas solids and liquid will have more modest (but not negligible) responses to changes in temperature.

## 4.3: Compressibility and Expansivity - Chemistry LibreTexts

The volume expansivity curve, shown as a dashed line in the Figure, can be seen to correspond to the ultra-low thermal expansion regime for the temperature interval 157–298 K, and is found to be zero at a temperature of  $\sim 219$  K. Fitting parameters for the 3 axes, the inter-axial angle, and the unit cell volume are listed in Table 1.

## The temperature-dependence of the volume expansivity and ...

Volume expansivity is the fractional increase in volume of a solid, liquid, or gas per unit rise in temperature, i.e.  $V_2 = V_1(1 + \gamma\theta)$ , where  $\gamma$  is the cubic expansivity and  $\gamma = 3\alpha$ . For liquids, the expansivity observed directly is called the apparent expansivity as the container will also have expanded with the rise in temperature.

Express the volume expansivity and the isothermal compressibility as functions of density  $\rho$  and its partial derivatives. For water at  $50^\circ\text{C}$  and 1 bar,  $\kappa = 44.18 \times 10^{-6} \text{ bar}^{-1}$ . To what pressure must water be compressed at  $50^\circ\text{C}$  to change its density by 1%?

## **relationship between area and volume expansivity**

The ratio of apparent increase in volume of the liquid per unit rise of temperature to the original volume is called its coefficient of apparent expansion. For small and equal rises in temperature, the increase in volume (real expansion) of a liquid is equal to the sum of the apparent increase in volume (apparent expansion) of the liquid and the increase in volume of the containing vessel.

$\gamma$  = coefficient of volume expansion Since, coefficient of linear expansion is in one direction and areal in two dimension followed by three dimension in case of volume expansion. So, to compensate that factor the relation between them will be like.  $\alpha = \beta / 2 = \gamma / 3$
