Initializing the Form. You generally implement the hosting code in the form's Load event handler. The following code shows the Load event handler, a handler for the WPF composite control's Loaded event, and declarations for several global variables that are used later.. In the Windows Forms Designer, double-click the form to create a Load event handler. At the top of Form1.cs, add the ...

WPF can't know on its own since we're hosting a non-WPF window, so instead it asks us by calling this. To answer, we just track state based on CoreWebView2 events that fire when it gains or loses focus. `NavigateToString(String)` Initiates a navigation to `htmlContent` as source HTML of a new document. Equivalent to calling `NavigateToString(String)`.
